

The WideTEK 48C is the first 48 inch wide format CIS scanner to come with its own 7.2 inch color touchscreen, a 64bit Linux PC with 8GB memory and a 1Gbit network connection.

The WideTEK 48C is a complete solution -- ready to scan even if only the very affordable base model is purchased. Unlike nearly all competing scanners, customers purchasing the WideTEK 48C will incur no additional costs for external PCs, monitors or additional software.

The 7 inch color touchscreen gives access to all functions directly from the scanner. It is very easy to access and it is operator-friendly because it is located right at the center of the scanner, where the operator is.

Other scanner vendors have varying degrees of machine control but almost all of them locate these at the rightmost perimeter of their scanners, not ergonomically ideal.

Running its own PC has many advantages. Other scanners have to specify the PC being used with respect to speed, memory, operating system and other factors before they can specify scanning speeds, maximum scanning width and length. The WideTEK 48C is different. Whether you scan via the built in touchscreen, via a TWAIN enabled software or even with a browser enabled cell phone, the scanning performance does not differ at all.

The WideTEK 48C is a true network scanner and installs very easily into today's office infrastructure. The scanner does not need any driver software or interface to be installed; it is ready to operate through the Scan2Net interface the minute after you have assigned it a valid IP address.

- ✓ PC and touchscreen inside, no hidden cost
- ✓ True standalone solution
- ✓ Fast Gigabit network connection
