The WideTEK 48C was developed with self-service and kiosk type applications in mind.

Two USB connectors at the front of the device make it easy to walk up to the scanner, plug in a USB storage device, scan your source document and walk away -- without the need for a connected PC, key to any self-service environment.

Scanner users simply press a button to save their images to a connected USB device and scan. Once they have scanned their documents, they can check the files stored on their USB device by selecting the link <u>USB Options</u>. This displays a list of files contained on their device, letting users check to ensure that all files are stored.
